Let  $L$  be the language of all strings consisting of  $n$  0's followed by  $n$  1's:  $L = \{e, 01, 0011, 000111, \dots\}$

2. Let  $L$  be the language of all strings of with equal number of 0's and 1's:

If  $w$  has an odd number of 1's, then so does  $z$ . By the inductive hypothesis,  $\hat{A}(z) = B$ , and the transitions of the DFA tell us  $\hat{A}(w) = B$ . Thus, in this case,  $\hat{A}(w) = A$  if and only if  $w$  has an even number of 1's.

Case 2:  $a = 1$ . If  $w$  has an even number of 1's, then  $z$

Automata - What is it? The term "Automata" is derived from the Greek word "?????????" which means "self-acting". An automaton (Automata in plural) is an abstract self-propelled computing device which follows a predetermined sequence of operations automatically. An automaton with a finite number of states is called a Finite Automaton (FA) or Finite State Machine (FSM).
