There is no sound in outer space. As a longitudinal wave, sound is a rapid variation in pressure that propagates. Regions of above normal pressure (regions under compression) are called compressions or condensations. Regions of below normal pressure (regions under tension) are called rarefactions or dilations.

'The nature of sound' considers the physical aspects of sound, which are far better understood than the emotional ones. It discusses pressure waves; how sound is carried; the velocity, refraction, frequency, and diffraction of sound; the power of sound, including loudness and the decibel measurement system; standing waves and resonances; charting sound; sound filters; and sound synthesis.

The nature of sound. Understanding the nature of sound, its properties and physics, is of prime importance for composers today. Chapter 3 examines both the physical and psychoacoustical properties of sound materials: time domain waveforms, the time-frequency domain, sound magnitude, zones of frequency and intensity, timescales of sound, the speed of sound, the size and shape of sounds, the perception of the rate of sound events, and timbre.

Most animal communication has evolved and now takes place in the context of a communication network, i.e. several signallers and receivers within communication range of each other. This idea follows naturally from the observation that many signals travel further than the average spacing between animals.

This is self evidently true for long-range signals, but at a high density the same is true for short-range signals (e.g. begging calls of nestling birds). This book provides a current summary of research on communication networks and appraises future prospects. It combines information from studies of several taxonomic groups (insects to people via fiddler crabs, fish, frogs, birds and mammals) and several signalling modalities (visual, acoustic and chemical signals). It also specifically addresses the many areas of interface between communication networks and other disciplines (from the

Natural Law, Constitutionalism, Reason of State, and War: Counter-Reformation Spanish Political Thought (Volumes I and II) aims at understanding how Spanish thinkers in the sixteenth and early seventeenth centuries approached the emerging institution of the state. The volumes are divided evenly into

four distinct but related parts that cover the Spaniards' central concerns. In the first, a fundamental question is asked: Is the state a natural institution? In the second, the theme is the best form of government. The third part is concerned with the imperative need to define the ethical boundaries beyond which the state must not trespass. Finally, the fourth part examines the question of war as an instrument of policy.

presenting physics concepts in a building-block fashion. In {Volume II} mathematical tools covered in {Volume I} are summarized in an Appendix, as a reference for learning the physics. As {Volume II} builds on the {Mechanics} of {Volume I}, it is expected that the student will have mastered the material of this earlier volume. The present volume begins with a historical review of how the atomic nature of matter was discovered. Then this background is applied in the study of solids, liquids, and gases. Next the kinetic nature of gases is extended to examine heat and temperature concepts for the

above states of matter. Following a study of heat transfer modes (conduction, convection, and radiation), thermodynamics is introduced to examine heat engines and the concept of entropy. Next a study of the general nature of waves is appropriate, since a number of wave speeds had already been developed in the preceding examination of mechanics, matter and heat. Finally, these wave concepts are applied to a study of sound, including human response and the nature of music. Near the end of each chapter a [Simple Projects] section suggests experiments and/or field trips that may serve to reinforce the physics

covered. Some of the experiments are simple enough for students to explore alone, while others benefit from equipment available to physics instructors. When opportune, the text develops relations that are revisited much later in the text. For example, both Chapters 16 and 17 develop the Stefan-Boltzmann radiation law, which is shown to be consistent with the Planck radiation law based on quantum concepts, in {Volume IV} Chapter 29. Also {optional} text sections provide students with a deeper appreciation of the subject matter; however they are not required for continuity. Some of these
