If the probability of winning on each occasion is 1 in 14 million, then the probability of not winning on each occasion is 13,999,999 in 14,000,000. Therefore the probability of failing to win on every occasion (out of 52) is $(13,999,999/14,000,000)^{52}$, i.e. 13,999,999 divided by 14,000,000 and raised to the power of 52.

Frequentist probability or frequentism is an interpretation of probability; it defines an event's probability as the limit of its relative frequency in many trials. Probabilities can be found (in principle) by a repeatable objective process (and are thus ideally devoid of opinion). This interpretation supports the statistical needs of many experimental scientists and pollsters.

Having spent several years in and out of hospitals for a life-threatening illness, pragmatic 16-year-old Cam is relocated by her miracle-seeking mother to a town in Maine known for its mystical healing qualities, a place Cam dismisses until she witnesses unusual phenomena and befriends a boy who encourages her to achieve various milestones before she dies. A first novel.

Lucy lives on the twenty-fourth floor. Owen lives in the basement. It's fitting, then, that they meet in the middle -- stuck between two floors of a New York City apartment building, on an elevator rendered useless by a citywide blackout. After they're rescued, Lucy and Owen spend the night wandering the darkened streets and marveling at the rare appearance of stars above Manhattan. But once the power is back, so is reality. Lucy soon moves abroad with her parents, while Owen heads out west with his father. The brief time they spend together leaves a mark. And as their lives take them to Edinburgh and to San Francisco, to Prague and to Portland, Lucy and Owen stay in touch through postcards, occasional e-mails, and phone calls. But can they -- despite the odds -- find a way to reunite? Smartly observed and wonderfully romantic, Jennifer E. Smith's new novel shows that the center of the world isn't necessarily a place. Sometimes, it can be a person.
